➡ ELIMINATE MANUAL TASKS & IMPROVE ACCURACY

A constantly growing variety of health insurance plans (including high deductible ones) – and other changes to the healthcare landscape – have caused an explosion of paper for hospitals of all sizes. As a result, automating the "paper chase" has become essential.

Speed up paper processes while improving accuracy with Ras Workflow Automation. Automation Modules allow users to automatically capture, process, access and distribute information. From providing secure report distribution via internal networks or web browsers to creating spreadsheets and providing on-demand EIS reports, emailing and electronic bursting of reports and information, Ras is the no-nonsense solution to manual data entry, tedious labor and paper-intensive processes.

> *With Ras, your information is wherever you need it, whenever you need it .... automatically.*

➡ CAPTURE

Forms/Custom Forms	Eliminate expensive pre-printed forms while accommodating quick access to patient and billing data with electronic capture of UB04s and CMS1500s. You can search and access data from any time period.
X12 Automatic Capture	Convert 837 transmissions and 835 receipts into a user-friendly, searchable database archive. Automatically capture, query, view, print and store transactions in an easy-to-read format. You'll also eliminate conversion programs for auditing and data query.
Scan-to-Ras	Convert scanned documents such as advanced directives, EOBs, insurance correspondence, clinical notes, contracts and resumes into searchable PDF files, which can be organized into patient, vendor or employee folders.
PDF Capture and Splitting	Archive and transfer documents with rich content (including color and graphic formatting).
HL7	Automatically capture HL7 transactions to create and maintain the Master Patient Index. You can also create in-house documents such as order forms, results and face sheets directly from HL7 transactions.

WORKFLOW AUTOMATION

dbtech SOLUTIONS

➡ PROCESS

Data Extraction

Auto-extract data from single or multiple sources to eliminate re-keying errors. Export data to a separate database program or format making information immediately available to executives for timely business decisions. You can also mine data to create interfaces and generate dashboard reports.

Custom Splitting

Automatically burst reports into several sectioned or departmental reports. Then auto-send to identified and authorized users. Reports may be split on any specified data element, including financial class, patient type, hospital code or other criteria.

➡ ACCESS

Rasi Web

Provide physicians, third-party organizations and authorized hospital employees with the ability to view Rasi patient folders (including electronic and scanned documents) via web browser.

Web Viewer

Access information anytime, anywhere. Deliver reports and forms that don't reside on a LAN or WAN automatically, with built-in encryption security. View information as if working in a network-based application.

Rasi SmartLinks

Automatically create links between Rasi patient folders and Ras documents to avoid the cost of expanding Rasi to all hospital departments.

➡ DISTRIBUTE

Autoprint

Automatically print sections or complete reports to any network printer.

Autoprint Forms

Automate the process of printing select forms. Once commands are set, specified forms will auto-print and distribute without user intervention.

E-mail Transfer

Eliminate manual faxing of hardcopy reports. Once commands are set, Ras converts data to a uniform PDF viewer, then auto-sends those select reports with HIPAA-required PHI security and encryption.

Integration

Extract data and update existing databases by instantly auto-merging and integrating independent applications. Send FTP files to remote locations, push reports to PDAs and fax servers or launch third-party applications while information is being automatically captured. Provides the ability to merge data from disparate systems.
